

Abstract

We reviewed 40 fictional patients taking CardioRelax 10 mg once daily. Two cases reported mild nausea after the first dose. No serious adverse events were recorded in the fictional cohort.

Methods

Records were abstracted from the fictional registry between January and March 2026. Demographics, dose and onset were tabulated.

Case vignette

Patient P-17, age 52, female, developed nausea within 2 hours of the first dose of CardioRelax 10 mg (Batch CR-4402). The event resolved by the next day without treatment.

Discussion

Product quality was normal for the batch; the event is consistent with a known tolerance effect. Complaints about tablet discoloration were not confirmed on inspection.
